

TCM 30W Transmitter Control Module

Benefits

- 110VAC or 12VDC backup powered
- Quality, reliable electronics with little to no maintenance required

Features

- Remote control command to set power level from 0 to 30 Watts in 0.1 watt increments
- Remote reporting allows you to read back the set power level, Reflected Power, VSWR, and Modulation Level
- Front-panel status indicators provide quick visual feedback on transmitter status
- Front panel power switch and I/O Connectors.

Overview

In a highway advisory radio (HAR) system, it is sometimes desirable to vary the power level of the transmitter output. This will increase or decrease the coverage area accordingly. The TCM Transmitter Control Module (when used in conjunction with the TXM4 transmitter) allows the power to be set to from 0.1 watts up to 30.0 watts.

The TCM-1 is controlled from the DR1500 recorder/player, which in turn can be controlled remotely using our Platinum software package.
